SAFEBOX

Iron carbon black box designed to secure the FAST MAX module and OEM wiring harness. The high strength enclosure and tamper proof shear screws protect all of the important parts from being removed by thieves. (Sold separately)

AUTOLOCK

FAST MAX allows the user to automatically block the throttle with each ignition cycle. The block will be automatically lifted after the FAST MAX senses a paired smartphone or magic key in close proximity.

Car ECU

Throttle

BLUETOOTH

Optional control for FAST MAX modules. Allows the user to unlock the Auto Lock using a user selected PIN code as well as controlling all other FAST functions without the need for a smartphone. (Sold separately, not compatible with FAST IP models)

MAGICKEY

Bluetooth proximity key fob to be used separately from the vehicle's key. If Magic Key is not present after starting the vehicle will have no acceleration. If the FAST MAX loses signal from the Magic Key a progressive lockdown of the pedal will start after a predetermined time and drop pedal to either 0% or 12% of input, selectable to remain legal in all regions.

GPS TRACKER

BLOCK OUTPUT

FAST MAX can communicate with GPS trackers, using their commands to block the pedal of the vehicle. Block generated with this input will progressively reduce the pedals output rendering the vehicle undriveable and in accordance with all traffic laws. Communication can be chosen at setup using three different easy options as well as an exclusive TURY protocol, making it compatible with all known tracking systems.

SMARTPHONE

If the FAST MAX does not detect a phone when started, the vehicle will have no acceleration. The app does not need to be open or active. When a paired phone is detected the pedal will perform normally.
